A Danish Based Company

# PHYSICAL SECURITY CONSULTANTS

## As safe as houses

Everyone has a right to feel safe. Whether at work, travelling through an airport, in a bank or visiting any other public or private building, no one should have to fear for their physical wellbeing.

At Vale, we are experts in assessing building-related physical security risks and tailoring risk management strategies to eliminate or reduce them. Should the worst ever happen, our goal is to ensure minimal consequences.

The following matrix identifies the relationship between the different components of risk management – this concept is the foundation of our services;

- Risk management matrix, derived from ISO Guide 51:1999 Safety aspects by AW, Excap.

- ALARP = As Low As Reasonably Practicable.

## Involve us from the start

The earlier you involve us in your construction project, the better we can integrate the optimum security measures in your building. Physical security considerations are as fundamental as the architectural design.

We develop risk management strategies for building, perimeter, shell and cell security. That means we can advise on everything, from walls, roofs and floors, to doors and windows, to extra security measures for specific areas within a building.

## What you can expect

Our risk analyses include assessments of explosion consequences and structural vulnerability. This gives you a well-documented basis for timely decision-making. After identifying potential risks, we talk you through the available options for safeguarding against them.

Once your decision is made, we then take on the task of project management, ensuring the agreed security measures are implemented with the right quality and at the agreed price – always on time.

## Our knowledge platform

Within the physical security field, our knowledge platform is unique for its combination of theoretical understanding and practical experience. You'll find our team a complementary mix of skilled building engineers and former military officers with a background in ammunition clearance and bomb squads. All our employees have security clearance from the Danish defence and security intelligence services.

One of our goals is to push standards of physical security to an ever-higher level. To this end, we run knowledge-sharing seminars, where we invite architects and engineers to participate. Making buildings safer is in everyone's interest.

## International cooperation and standards

Access to a worldwide network of specialists keeps us abreast of the latest developments in physical security technology. This includes computer simulations that provide a realistic picture of how the force of an explosion spreads. Such simulations provide valuable input for determining how and where a building should be reinforced.

In all our recommendations, we adhere to recognised international standards. You'll find a complete list of the standards we meet on our website:

[www.vale-psc.com](http://www.vale-psc.com).

## **Protect your people, your premises and your reputation**

At Vale, we are specialists in assessing physical security risks to buildings and proposing the optimum risk management solution. Contact us to find out more about making your building a safer place.
